

Weekly Data Viz Report #5

Zhizhou Xu

Wildlife is making a comeback in Europe

Shown is the average relative change in the abundance (the number of individuals in a population) of animals across selected mammal populations in Europe. For example, the numbers for Eurasian beavers shows the average relative change in the abundance of beavers between 1960 and 2016 across 98 studied populations.

Our World
in Data

data url: <https://ourworldindata.org/europe-mammal-comeback>

The data viz shows the average relative change in animal populations from different animal species. As we can see, the change is positive and significant. Some of the populations of the animals increased by over 1000% during the past few decades, which means compared with decades ago, the habitat of animals has become better under the protection of people, and the protection of wild animals has achieved substantial results.
